

SOLAR SYSTEM

The solar system consist of a star, eight planet and many other small bodies. The sun being largest body in our system which revolves around the center of our galaxy, the Milky Way. The eight planets and smaller bodies revolve around the sun.

This model of the solar system give you the eight planets to scale, earth's moon and just a fraction of the sun. Also included are the 6-inch high names of each planet and the sun. Children can learn the names of the planet, their order from the sun and get an idea of the planets sizes relative to each other.

At the same scale the sun would be a 28-foot diameter circle and you would need approximately 17 miles to lie out the solar system correctly.
